

ESERCIZIO GIORNATA 6

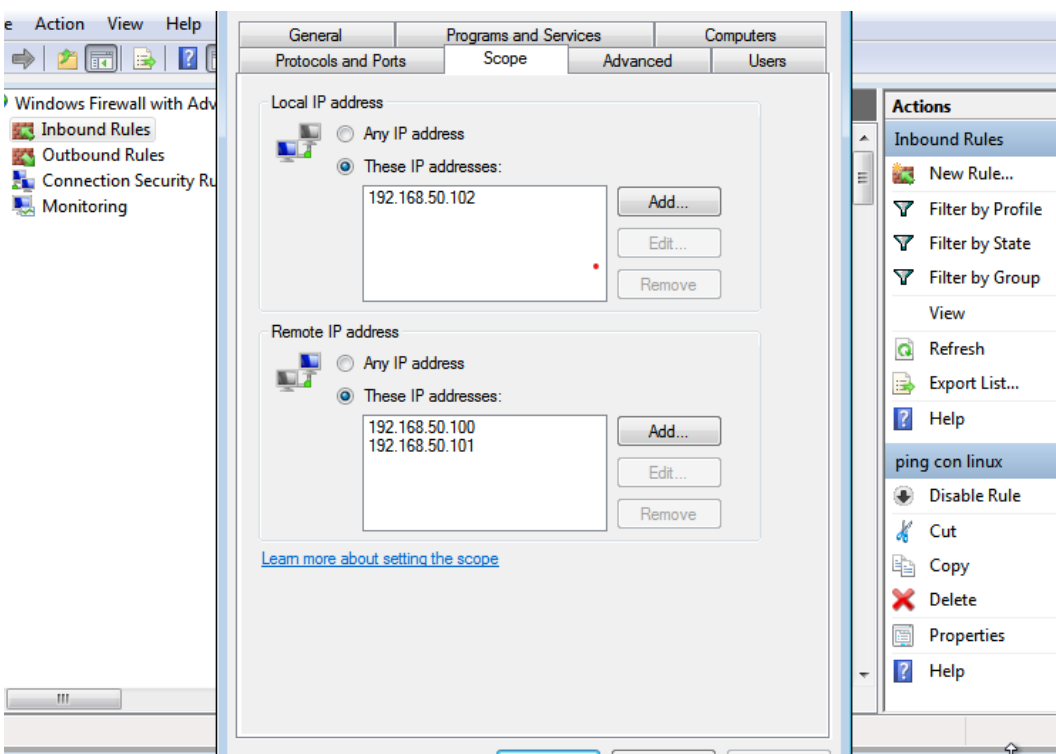

Oggi ci è stato chiesto di configurare una policy del software firewall e di fare una packet capture usando Wireshark tramite l'utilizzo delle nostre macchine virtuali Kali e quella Win.7.

Configurazione Policy:

Accedendo alla sezione "Windows Firewall Advanced Security" e selezionando la voce "inbound rules" (come possiamo vedere in figura) sono andato a creare una nuova "regola" nella voce "Action". Dopo aver configurato alcune impostazioni, sono andato nella voce "scope" e ho impostato manualmente il Local IP, mettendo come IP quello assegnato alla macchina WIN.7, e come Remote IP quelli delle macchine linux.

Facendo ciò ho permesso nonostante la presenza del firewall il ping tra le varie macchine. Per controllare se l'operazione fosse andata a buon fine, mi sono spostato sulla macchina Linux Kali e avviando il tool Wireshark ho controllato fosse presente il traffico di informazioni tra le due macchine.

done.
Simulation running.
```

Emulazione servizi internet e uso di Wireshark:

Wireshark interface showing a packet capture on the loopback interface. The selected packet is a TCP ACK (Seq=432, Ack=409) from 127.0.0.1 to 127.0.0.1. The packet details show the TCP header and the application/javascript content type.
